

## Abstract of the Disclosure

A teletext program includes several teletext pages, with each teletext page being broadcast in the form of a set of data packets. A method for displaying a teletext program index on a television receiver screen includes receiving a teletext page which includes the set of data packets. The set of data packets includes first and second data packets. The first data packet includes at least one label referring to another teletext page, and the second data packet is associated with the first data packet and includes a page number associated with at least one label. The method includes decoding the first and second data packets to obtain at least one label and the associated page number, and at least one label and the associated page number are stored in a buffer memory.
